### Practical intro

Introduction

When exercises are too easy/difficult, students get bored/discouraged.

To personalize assessment,

 $\Rightarrow \rightarrow$  need a model of how people respond to exercises.

#### Example

To personalize this presentation,

 $\Rightarrow \rightarrow$  need a model of how people respond to my slides.

p(understanding)

Practical: 0.9

Theoretical: 0.6

### Theoretical intro

Introduction

Let us assume x is sparse.

Linear regression  $y = \langle \boldsymbol{w}, \boldsymbol{x} \rangle$ 

Logistic regression  $y = \sigma(\langle \boldsymbol{w}, \boldsymbol{x} \rangle)$  where  $\sigma$  is sigmoid.

Neural network  $x^{(L+1)} = \sigma(\langle \mathbf{w}, \mathbf{x}^{(L)} \rangle)$  where  $\sigma$  is ReLU.

What if  $\sigma: x \mapsto x^2$  for example?

Polynomial kernel  $y = \sigma(1 + \langle \boldsymbol{w}, \boldsymbol{x} \rangle)$  where  $\sigma$  is a monomial.

Factorization machine  $y = \langle w, x \rangle + ||Vx||^2$ 

Mathieu Blondel, Masakazu Ishihata, Akinori Fujino, and Naonori Ueda (2016). "Polynomial networks and factorization machines: new insights and efficient training algorithms". In: Proceedings of the 33rd International Conference on International Conference on Machine Learning-Volume 48. JMLR. org, pp. 850-858

### Language Learning

|          | PRON | VERB | PRON | NOUN   | CONJ | PRON | VERB | PRON | NOUN   |
|----------|------|------|------|--------|------|------|------|------|--------|
| correct: | She  | is   | my   | mother | and  | he   | is   | my   | father |
| student: | she  | is   |      | mader  | and  | he   | is   |      | fhader |
| label:   | 0    | 0    | ×    | ×      | 0    | 0    | 0    | ×    | ×      |

### Challenges

- Users can attempt a same item multiple times
- Users learn over time
- People can make mistakes that do not reflect their knowledge

## Predicting student performance: knowledge tracing

#### Data

Introduction

A population of users answering items

• Events: "User i answered item j correctly/incorrectly"

Side information

- If we know the skills required to solve each item  $e.g., +, \times$
- Class ID, school ID, etc.

#### Goal: classification problem

Predict the performance of new users on existing items\ Metric: AUC

#### Method

Learn parameters of questions from historical data e.g., difficulty Measure parameters of new students e.g., expertise

# Existing work

| Model   | Basically                  | Original<br>AUC | Fixed<br>AUC |

Introduction

### Limitations and contributions

- Several models for knowledge tracing were developed independently
- In our paper, we prove that our approach is more generic

#### Our contributions

- Knowledge Tracing Machines unify most existing models
  - Encoding student data to sparse features
  - Then running logistic regression or factorization machines
- Better models found
  - It is better to estimate a bias per item, not only per skill
  - Side information improves performance more than higher dim.

### Our small dataset

Introduction

- User 1 answered Item 1 correct
- User 1 answered Item 2 incorrect
- User 2 answered Item 1 incorrect
- User 2 answered Item 1 correct
- User 2 answered Item 2 ???

| user | item | correct |
|------|------|---------|
| 1    | 1    | 1       |
| 1    | 2    | 0       |
| 2    | 1    | 0       |
| 2    | 1    | 1       |
| 2    | 2    | ???     |
|      |      |         |

Introduction

## Model 1: Item Response Theory

Learn abilities  $\theta_i$  for each user iLearn easiness  $e_j$  for each item j such that:

$$Pr(\mathsf{User}\ i\ \mathsf{Item}\ j\ \mathsf{OK}) = \sigma(\theta_i + e_j) \quad \sigma: x \mapsto 1/(1 + \exp(-x))$$
  
 $\operatorname{logit} Pr(\mathsf{User}\ i\ \mathsf{Item}\ j\ \mathsf{OK}) = \theta_i + e_j$ 

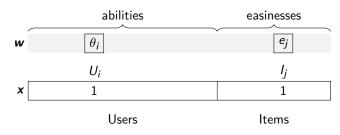

Really popular model, used for the PISA assessment

#### Logistic regression

Learn **w** such that  $\operatorname{logit} Pr(\mathbf{x}) = \langle \mathbf{w}, \mathbf{x} \rangle + b$ 

## Graphically: IRT as logistic regression

Encoding "User i answered Item j" with sparse features:

$$\langle \boldsymbol{w}, \boldsymbol{x} \rangle = \theta_i + e_j = \operatorname{logit} Pr(\operatorname{User} i \operatorname{Item} j \operatorname{OK})$$

## Encoding into sparse features

|       | Users | Items |                       |       |       |  |
|-------|-------|-------|-----------------------|-------|-------|--|
| $U_0$ | $U_1$ | $U_2$ | <i>I</i> <sub>0</sub> | $I_1$ | $I_2$ |  |
| 0     | 1     | 0     | 0                     | 1     | 0     |  |
| 0     | 1     | 0     | 0                     | 0     | 1     |  |
| 0     | 0     | 1     | 0                     | 1     | 0     |  |
| 0     | 0     | 1     | 0                     | 1     | 0     |  |
| 0     | 0     | 1     | 0                     | 0     | 1     |  |

Then logistic regression can be run on the sparse features.

# Oh, there's a problem

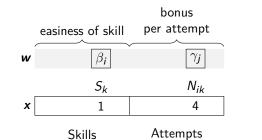

|                   |       | Users |       |                       | tems  | 5                     |               |   |
|-------------------|-------|-------|-------|-----------------------|-------|-----------------------|---------------|---|
|                   | $U_0$ | $U_1$ | $U_2$ | <i>I</i> <sub>0</sub> | $I_1$ | <i>I</i> <sub>2</sub> | <b>y</b> pred | y |
| User 1 Item 1 OK  | 0     | 1     | 0     | 0                     | 1     | 0                     | 0.575135      | 1 |
| User 1 Item 2 NOK | 0     | 1     | 0     | 0                     | 0     | 1                     | 0.395036      | 0 |
| User 2 Item 1 NOK | 0     | 0     | 1     | 0                     | 1     | 0                     | 0.545417      | 0 |
| User 2 Item 1 OK  | 0     | 0     | 1     | 0                     | 1     | 0                     | 0.545417      | 1 |
| User 2 Item 2 NOK | 0     | 0     | 1     | 0                     | 0     | 1                     | 0.366595      | 0 |

We predict the same thing when there are several attempts.

# Count number of attempts: AFM

Keep a counter of attempts at skill level:

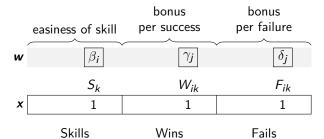

| user | item | skill | correct | attempts<br>(for the same skill) |
|------|------|-------|---------|----------------------------------|
| 1    | 1    | 1     | 1       | 0                                |
| 1    | 2    | 2     | 0       | 0                                |
| 2    | 1    | 1     | 0       | 0                                |
| 2    | 1    | 1     | 1       | 1                                |
| 2    | 2    | 2     | 0       | 0                                |

### Count successes and failures: PFA

Count separately successes  $W_{ik}$  and fails  $F_{ik}$  of student i over skill k.

| user | item | skill | correct | wins | fails |
|------|------|-------|---------|------|-------|
| 1    | 1    | 1     | 1       | 0    | 0     |
| 1    | 2    | 2     | 0       | 0    | 0     |
| 2    | 1    | 1     | 0       | 0    | 0     |
| 2    | 1    | 1     | 1       | 0    | 1     |
| 2    | 2    | 2     | 0       | 0    | 0     |
|      |      |       |         |      |       |

# Model 2: Performance Factor Analysis

 $W_{ik}$ : how many successes of user i over skill k ( $F_{ik}$ : #failures)

Learn  $\beta_k$ ,  $\gamma_k$ ,  $\delta_k$  for each skill k such that:

$$\operatorname{logit} \mathit{Pr}(\operatorname{\mathsf{User}}\ i\ \operatorname{\mathsf{Item}}\ j\ \operatorname{\mathsf{OK}}) = \sum_{\mathsf{Skill}\ k\ \mathrm{of}\ \mathsf{Item}\ j} rac{oldsymbol{eta_k}}{oldsymbol{eta_k}} + W_{ik} \gamma_{k} + F_{ik} rac{\delta_{k}}{oldsymbol{k}}$$

|                       | Skills | ;     |       | Wins  |       | Fails |       |       |  |
|-----------------------|--------|-------|-------|-------|-------|-------|-------|-------|--|
| <i>S</i> <sub>0</sub> | $S_1$  | $S_2$ | $S_0$ | $S_1$ | $S_2$ | $S_0$ | $S_1$ | $S_2$ |  |

## Test on a large dataset: Assistments 2009

346860 attempts of 4217 students over 26688 items on 123 skills.

| the state of the s | model  | dim | AUC            | improvement |
|--|--|-----|----------------|-------------|
| Arivi: skills, attempts 0 0.010  | PFA: skills, wins, fails AFM: skills, attempts | 0   | 0.685<br>0.616 | +0.07       |

# Model 3: a new model (but still logistic regression)

| model                           | dim | AUC   | improvement |
|---------------------------------|-----|-------|-------------|
| KTM: items, skills, wins, fails | 0   | 0.746 | +0.06       |
| IRT: users, items               | 0   | 0.691 |             |
| PFA: skills, wins, fails        | 0   | 0.685 | +0.07       |
| AFM: skills, attempts           | 0   | 0.616 |             |

## Here comes a new challenger

How to model pairwise interactions with side information?

#### Logistic Regression

Introduction

Learn a 1-dim bias for each feature (each user, item, etc.)

#### **Factorization Machines**

Learn a 1-dim bias and a k-dim embedding for each feature

### How to model pairwise interactions with side information?

If you know user *i* attempted item *j* on mobile (not desktop) How to model it?

y: score of event "user i solves correctly item j"

#### **IRT**

Introduction

$$y = \theta_i + e_j$$

### Multidimensional IRT (similar to collaborative filtering)

$$y = \theta_i + e_j + \langle \mathbf{v}_{\mathsf{user}} \,_i, \mathbf{v}_{\mathsf{item}} \,_j \rangle$$

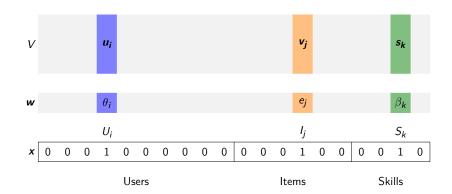

#### With side information

$$y = \theta_i + e_j + \underline{\mathsf{w}_{\mathsf{mobile}}} + \left\langle \mathbf{v}_{\mathsf{user}\; i}, \mathbf{v}_{\mathsf{item}\; j} \right\rangle + \left\langle \mathbf{v}_{\mathsf{user}\; i}, \underline{\mathbf{v}_{\mathsf{mobile}}} \right\rangle + \left\langle \mathbf{v}_{\mathsf{item}\; j}, \underline{\mathbf{v}_{\mathsf{mobile}}} \right\rangle$$

# Graphically: logistic regression

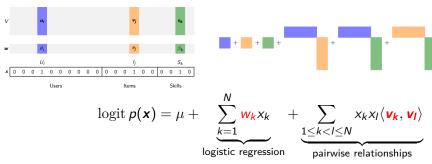

## Graphically: factorization machines

# Formally: factorization machines

Introduction

Each user, item, skill k is modeled by bias  $w_k$  and embedding  $v_k$ .

Steffen Rendle (2012). "Factorization Machines with libFM". In: ACM Transactions on Intelligent Systems and Technology (TIST) 3.3, 57:1-57:22. DOI: 10.1145/2168752.2168771

# Training using MCMC

Introduction

```
Priors: w_k \sim \mathcal{N}(\mu_0, 1/\lambda_0) v_k \sim \mathcal{N}(\mu, \Lambda^{-1})
Hyperpriors: \mu_0, \ldots, \mu_n \sim \mathcal{N}(0, 1), \lambda_0, \ldots, \lambda_n \sim \Gamma(1, 1) = U(0, 1)
```

#### **Algorithm 1** MCMC implementation of FMs

for each iteration do

Sample hyperp.  $(\lambda_i, \mu_i)_i$  from posterior using Gibbs sampling

Sample weights w

Sample vectors **V** 

Sample predictions v

end for

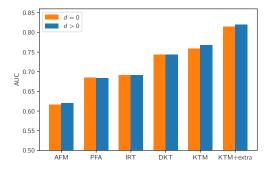

Implementation in C++ (libFM) with Python wrapper (pyWFM).

Steffen Rendle (2012). "Factorization Machines with libFM". In: ACM Transactions on Intelligent Systems and Technology (TIST) 3.3, 57:1-57:22. DOI: 10.1145/2168752.2168771

### Datasets

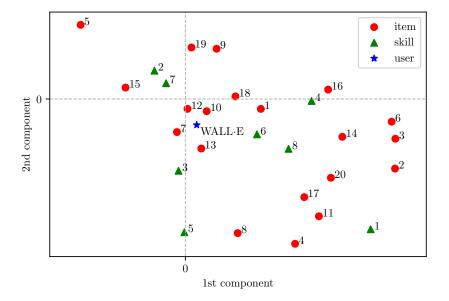

| Name        | Users | Items | Skills | Skills/i | Entries | Sparsity | Attempts/u |
|-------------|-------|-------|--------|----------|---------|----------|------------|
| fraction    | 536   | 20    | 8      | 2.800    | 10720   | 0.000    | 1.000      |
| timss       | 757   | 23    | 13     | 1.652    | 17411   | 0.000    | 1.000      |
| ecpe        | 2922  | 28    | 3      | 1.321    | 81816   | 0.000    | 1.000      |

### AUC results on the Assistments dataset

| model                                  | dim | AUC   | improvement |
|--|-----|-------|-------------|
| KTM: items, skills, wins, fails, extra | 5   | 0.819 |             |
| KTM: items, skills, wins, fails, extra | 0   | 0.815 | +0.05       |
| KTM: items, skills, wins, fails        | 10  | 0.767 |             |
| KTM: items, skills, wins, fails        | 0   | 0.759 | +0.02       |
| DKT (Wilson et al., 2016)              | 100 | 0.743 | +0.05       |
| IRT: users, items                      | 0   | 0.691 |             |
| PFA: skills, wins, fails               | 0   | 0.685 | +0.07       |
| AFM: skills, attempts                  | 0   | 0.616 |             |

# Bonus: interpreting the learned embeddings

Conclusion

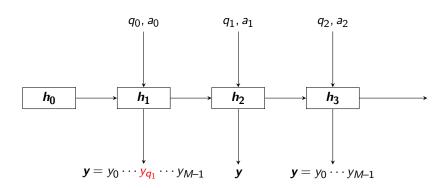

### What 'bout recurrent neural networks?

Introduction

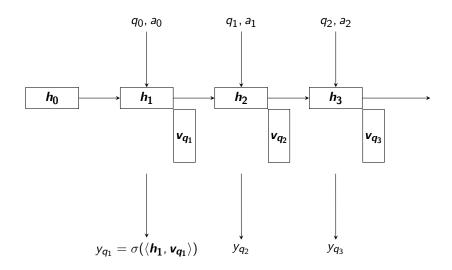

Deep Knowledge Tracing: model the problem as sequence prediction

- Each student on skill  $q_t$  has performance  $a_t$
- How to predict outcomes y on every skill k?
- Spoiler: by measuring the evolution of a latent state  $h_t$

## Graphically: deep knowledge tracing

## Graphically: there is a MIRT in my DKT

# Drawback of Deep Knowledge Tracing

DKT does not model individual differences.

Actually, Wilson even managed to beat DKT with (1-dim!) IRT.

By estimating on-the-fly the student's learning ability, we managed to get a better model.

| AUC              | BKT  | IRT  | PFA  | DKT  | DKT-DSC |
|------------------|------|------|------|------|---------|
| Assistments 2009 | 0.67 | 0.75 | 0.70 | 0.73 | 0.91    |
| Assistments 2012 | 0.61 | 0.74 | 0.67 | 0.72 | 0.87    |
| Assistments 2014 | 0.64 | 0.67 | 0.69 | 0.72 | 0.87    |
| Cognitive Tutor  | 0.61 | 0.81 | 0.76 | 0.79 | 0.81    |

# Take home message

Knowledge tracing machines unify many existing EDM models

- Side information improves performance more than higher d
- We can visualize learning (and provide feedback to learners)

Already provides better results than vanilla deep neural networks

Can be combined with FMs
